

ABSTRACT

A method and system for cross-system authentication or credentialing of clients.

Credentials from one system (*e.g.*, system 2) are placed on a client, such as with a cookie

on a browser, and the credentials are then extracted by another system (*e.g.*, system 1),

5 and used by system 1 to impersonate the client to system 2. If the client's credentials

with system 2 are valid, system 2 provides that information to system 1 (which is

impersonating the client), and system 1 uses the validity of the credentials from system 2

to grant the client access to protected resources on system 1.
